

Tutorial 3 - Arrays

Q1

- (a) What is the output of the program if the addition of 1 to every element of the two-dimensional array 'array' is done in the following program?
- (b) What if the for statement at 'line a' is replaced by this statement: `add1(array[0], 3 * 4);`

```
#include <stdio.h>
void add1(int ar[], int size);
int main()
{
    int array[3][4]={1,2,3,4,    5,6,7,8,    9,10,11,12};
    int h,k;

    for (h = 0; h < 3; h++) /*line a*/
        add1(array[h], 4);

    for (h = 0; h < 3; h++) {
        for (k = 0; k < 4; k++)
            printf("%10d", array[h][k]);
        putchar('\n');
    }
    return 0;
}
```

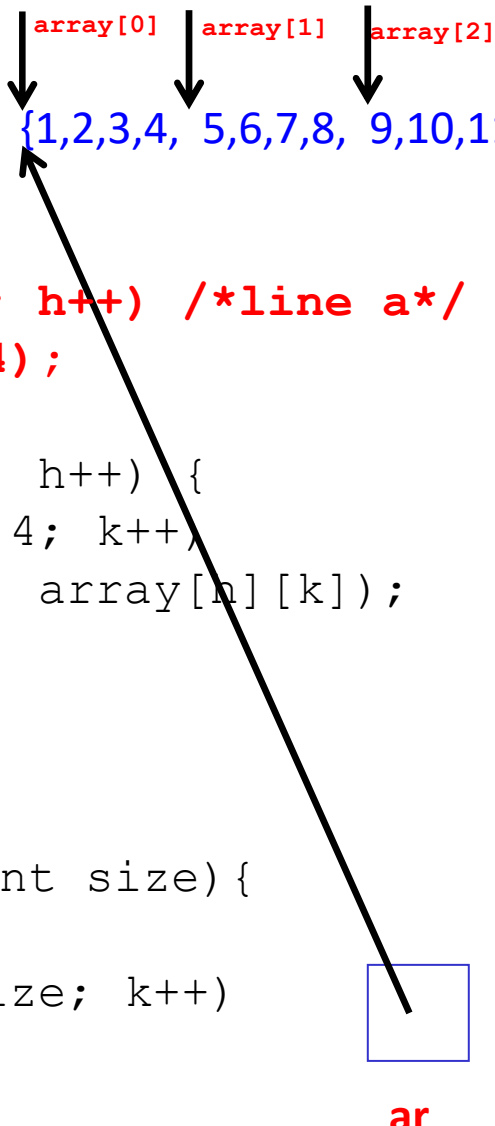

Q1 (a) – Suggested Answer

```
#include <stdio.h>
void add1(int ar[], int size);
int main()
{
    int array[3][4] = {1,2,3,4, 5,6,7,8, 9,10,11,12};
    int h,k;

    for (h = 0; h < 3; h++) /*line a*/
        add1(array[h], 4);

    for (h = 0; h < 3; h++) {
        for (k = 0; k < 4; k++)
            printf("%10d", array[h][k]);
        putchar('\n');
    }
    return 0;
}

void add1(int ar[], int size){
    int k;
    for (k = 0; k < size; k++)
        ar[k]++;
}
```

(a) What is the output of the program if the addition of 1 to every element of the two-dimensional array 'array' is done in the program?

Output:

2	3	4	5
6	7	8	9
10	11	12	13

Q1 (a) – Suggested Answer

(a) What is the output of the program if the addition of 1 to every element of the two-dimensional array 'array' is done in the following program?

Answer:

The function `add1()` has two parameters. The first one is an array address and the second one is the size of the array. So the function adds 1 to every element of the one-dimensional array.

When the function is called in the for statement at line a by

```
add1(array[h], 4);
```

`array[h]` is an one-dimensional array of 4 integers. It is the $(h+1)$ th row of the two-dimensional array 'array'.

In fact, `array[h]` is the address of the first element of the $(h+1)$ th row. So every function call works on one row of the two-dimensional array.

Q1 (b) – Suggested Answer

```
#include <stdio.h>
void add1(int ar[], int size);
int main()
{
    int array[3][4] = {1,2,3,4, 5,6,7,8, 9,10,11,12};
    int h,k;

    add1(array[0], 3 * 4); /*line a*/

    for (h = 0; h < 3; h++) {
        for (k = 0; k < 4; k++)
            printf("%10d", array[h][k]);
        putchar('\n');
    }
    return 0;
}

void add1(int ar[], int size){
    int k;
    for (k = 0; k < size; k++)
        ar[k]++;
}
```

array[0]

(b) What if the **for** statement at '**line a**' is replaced by this statement:

add1(array[0], 3 * 4);

Output:

2	3	4	5
6	7	8	9
10	11	12	13

ar

Q1 (b) – Suggested Answer

(b) What if the for statement at 'line a' is replaced by this statement: `add1(array[0], 3 * 4);`

Answer:

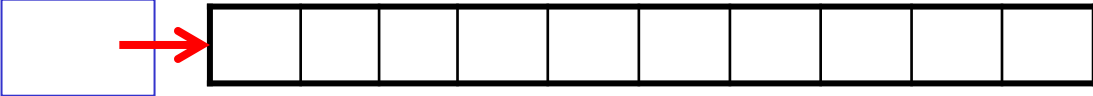

When the for statement at line a is replaced by `add1(array[0], 3*4)`, it is passing the address of the first element of the first row to `add1()` and telling the function that the array size is 12. So `add1()` works on an one dimensional array starting at `array[0]` and with 12 elements.

Arrays – Q2

Write a program which will draw the histogram for n integers from 0 to 99. n is input by the user. Each of the n numbers will be generated by calling **rand() % 100**. The program will consist of two functions (i) to collect the frequency distribution of the numbers (ii) to print the histogram. An example histogram is shown here.

```
0 – 9      | *****
10 – 19    | *****
20 – 29    | *****
30 – 39    | **
.....
90 – 99    | *****
```

Q2 – Suggested Answers

```
#include <stdio.h>
#include <stdlib.h>
#include <time.h>
void getFrequency(int histogram[10], int n);
void printFrequency(int histogram[10]);
int main()
{
    frequencies 
    int frequencies[10];
    int total;

    printf("Please input the number of random numbers: ");
    scanf("%d", &total);
    srand(time(NULL)) ;    // generate a seed number
    getFrequency(frequencies, total);
    printFrequency(frequencies);
    return 0;
}
```

histogram

```
void getFrequency(int histogram[10], int n)
{
    int count;
    // int category;

    for (count = 0; count < 10; count++)
        histogram[count] = 0;
    for (count = 0; count < n; count++)
        histogram[(rand() % 100) / 10]++;
    /* or category = (rand() % 100) / 10;
        histogram[category]++; */
}
```

**Using call by
reference for
passing array
between
functions**

Note that the '/' operator will divide the data (0-99) into 10 categories/groups [i.e. 0 to 9]. Each category will form an index for the array.

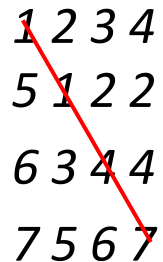

```
void printFrequency(int histogram[10])
{
    int count, index;

    for (count = 0; count < 10; count++) {
        printf("%2d--%2d  |", count*10, count*10+9);
        for (index = 0; index < histogram[count]; index++ )
            putchar('*');
        putchar('\n');
    }
}
```

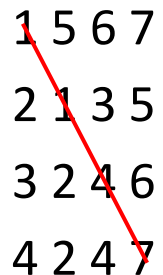

Arrays - Q3

Write a function that takes a square matrix ar, and the array sizes for the rows and columns as parameters, and returns the transpose of the array via call by reference. For example, if the rowSize is 4, colSize is 4, and the array ar is {1,2,3,4, 1,1,2,2, 3,3,4,4, 4,5,6,7}, then the resultant array will be {1,1,3,4, 2,1,3,5, 3,2,4,6, 4,2,4,7}. That is, for the 4-by-4 matrix:

1	2	3	4
5	1	2	2
6	3	4	4
7	5	6	7

the resultant array after performing the transpose2D function is:

1	5	6	7
2	1	3	5
3	2	4	6
4	2	4	7

The function prototype is given below:

```
void transpose2D(int ar[][SIZE], int rowSize, int colSize);
```

SIZE is a constant defined at the beginning of the program. For example, `#define SIZE 10`. The parameters `rowSize` and `colSize` are used to specify the dimensions of the 2-dimensional array (e.g. 4x4) that the function should process.

Write a program to test the function.

Q3 – Suggested Answers

```
#include <stdio.h>
#define SIZE 10
void transpose2D(int ar[][SIZE], int rowSize, int colSize);
void display(int ar[][SIZE], int rowSize, int colSize);
int main()
{
    int ar[SIZE][SIZE], rowSize, colSize;
    int i,j;

    printf("Enter row size of the 2D array: \n");
    scanf("%d", &rowSize);
    printf("Enter column size of the 2D array: \n");
    scanf("%d", &colSize);
    printf("Enter the matrix (%dx%d): \n", rowSize, colSize);
    for (i=0; i<rowSize; i++)
        for (j=0; j<colSize; j++)
            scanf("%d", &ar[i][j]);
    printf("transpose2D(): \n");
    transpose2D(ar, rowSize, colSize);
    display(ar, rowSize, colSize);
    return 0;
}
```

Q3 – Suggested Answers

```
void display(int ar[][SIZE], int rowSize, int colSize)
{
    int l,m;
    for (l = 0; l < rowSize; l++) {
        for (m = 0; m < colSize; m++)
            printf("%d ", ar[l][m]);
        printf("\n");
    }
}
```

```

void transpose2D(int ar[][SIZE], int rowSize, int
colSize)
{
    int h, k;
    int temp;
    for (h = 1; h < rowSize; h++)           // traverse row
        for (k = 0; k < h; k++) {           // process column
            temp = ar[h][k];                 // swap operation
            ar[h][k] = ar[k][h];
            ar[k][h] = temp;
        }
}

```

Note: For Transpose - swapping of $ar[row][column]$ with $ar[column][row]$
e.g. $ar[1][0]$ will be swapped with $ar[0][1]$

Arrays - Q4

A square matrix (2-dimensional array of equal dimensions) can be reduced to upper-triangular form by setting each diagonal element to the sum of the original elements in that column and setting to 0s all the elements below the diagonal.

For example, the 4-by-4 matrix:

4	3	8	6
9	0	6	5
5	1	2	4
9	8	3	7

would be reduced to

27	3	8	6
0	9	6	5
0	0	5	4
0	0	0	7

Write a function to reduce a matrix with dimensions of *rowSize* and *colSize*.

The prototype of the function is:

```
void reduceMatrix(int matrix[][SIZE], int rowSize, int colSize);
```

SIZE is a constant defined at the beginning of the program. For example, #define SIZE 10. The parameters rowSize and colSize are used to specify the dimensions of the 2-dimensional array (e.g. 4x4) that the function should process.

Write a program to test the function.

Q4 – Suggested Answers

```
#include <stdio.h>
#define SIZE 10
void reduceMatrix2D(int ar[][SIZE], int rowSize, int colSize);
void display(int ar[][SIZE], int rowSize, int colSize);
int main()
{
    int ar[SIZE][SIZE], rowSize, colSize;
    int i,j;
    printf("Enter row size of the 2D array: \n");
    scanf("%d", &rowSize);
    printf("Enter column size of the 2D array: \n");
    scanf("%d", &colSize);
    printf("Enter the matrix (%dx%d): \n", rowSize, colSize);
    for (i=0; i<rowSize; i++)
        for (j=0; j<colSize; j++)
            scanf("%d", &ar[i][j]);
    reduceMatrix2D(ar, rowSize, colSize);
    printf("reduceMatrix2D(): \n");
    display(ar, rowSize, colSize);
    return 0;
}
```

Q3 – Suggested Answers

```
void display(int ar[][SIZE], int rowSize, int colSize)
{
    int l,m;
    for (l = 0; l < rowSize; l++) {
        for (m = 0; m < colSize; m++)
            printf("%d ", ar[l][m]);
        printf("\n");
    }
}
```

```

void reduceMatrix2D(int matrix[][SIZE], int rowSize, int
colSize)
{
    int i, j, sum;           // i for row, j for column

    for (j = 0; j < colSize; j++){ // traverse column
        sum = 0;
        for (i = j+1; i < rowSize; i++){ // process row
            sum += matrix[i][j];
            matrix[i][j] = 0;
        }
        matrix[j][j] += sum;
    }
}

```

Enter the matrix (4x4):

	Col j	→		
	1	2	3	4
Row i	5	6	7	8
	9	10	11	12
	13	14	15	16

A red diagonal line is drawn from the top-left cell (1, 5) to the bottom-right cell (4, 16). The first column (1, 5, 9, 13) is circled in blue. A red arrow points down from the 'Row i' label to the first column. A pink arrow points from the matrix to the result table.

reduceMatrix2D() :

28	2	3	4
0	30	7	8
0	0	26	12
0	0	0	16
